1. Identify the Problem and Existing Process

1. Briefly describe the problem you've chosen and why it's an issue.

- Users are unable to plan their travels accurately, resulting in missing buses, prolonged wait times, and general unhappiness with the bus service. The lack of a systematic and user-friendly approach for communicating schedule changes exacerbates these challenges, necessitating the development of a more efficient alternative.

2. Explain the current process for dealing with this problem. Be specific about the steps involved and the tools used (if any).

- The proposed bus schedule management software would replace the present inefficient approach with real-time notifications, personalized schedules, and reminder alerts, resulting in more accurate, user-friendly, and comfortable commutes.

3. Discuss the limitations or inefficiencies of the current process.

- The current process is limited by small, hard-to-read printed schedules, outdated information, ineffective WhatsApp updates, and the need for users to manually track schedule changes.

4. Explain how a mobile app can improve this process and make it more efficient or convenient.

- A mobile app can improve efficiency and convenience by providing real-time notifications for schedule changes, allowing users to personalize their timetables for specific routes and times, and enabling reminder alerts to ensure users never miss their bus, eliminating the need for difficult-to-read printed schedules, lowering the risk of outdated information, and streamlining communication through a centralized platform.

2. Functional Requirements

1. Homepage

- 1.1 This page will show a search button for the destination that the user requests.
- 1.2 This page will also show a button with the location for the full schedule.
- 1.3 This page also will show a button for the set reminder setting.

2. Destination search button.

- 2.1 Users are able to search the destination that they desire.
- 2.2 Users also will be able to obtain an updated schedule for that day and destination.

Input: Location name

Output: Updated bus schedule for that day.

3. Full Schedule

- 3.1 Users are able to see the full bus schedule.

Input: Click the full schedule location button

Output: Show full bus schedule.

4. Set Reminder

- 4.1 Users are able to set the reminder to notice them before the bus arrives.
- 4.2 Users are also able to remove the reminder.

Input: Set the time and click button done.

Output: The reminder should remind the user before the bus arrives.

5. Drop down button

5.1 Users are able to select the destination option.

5.2 Users are able to select the day.

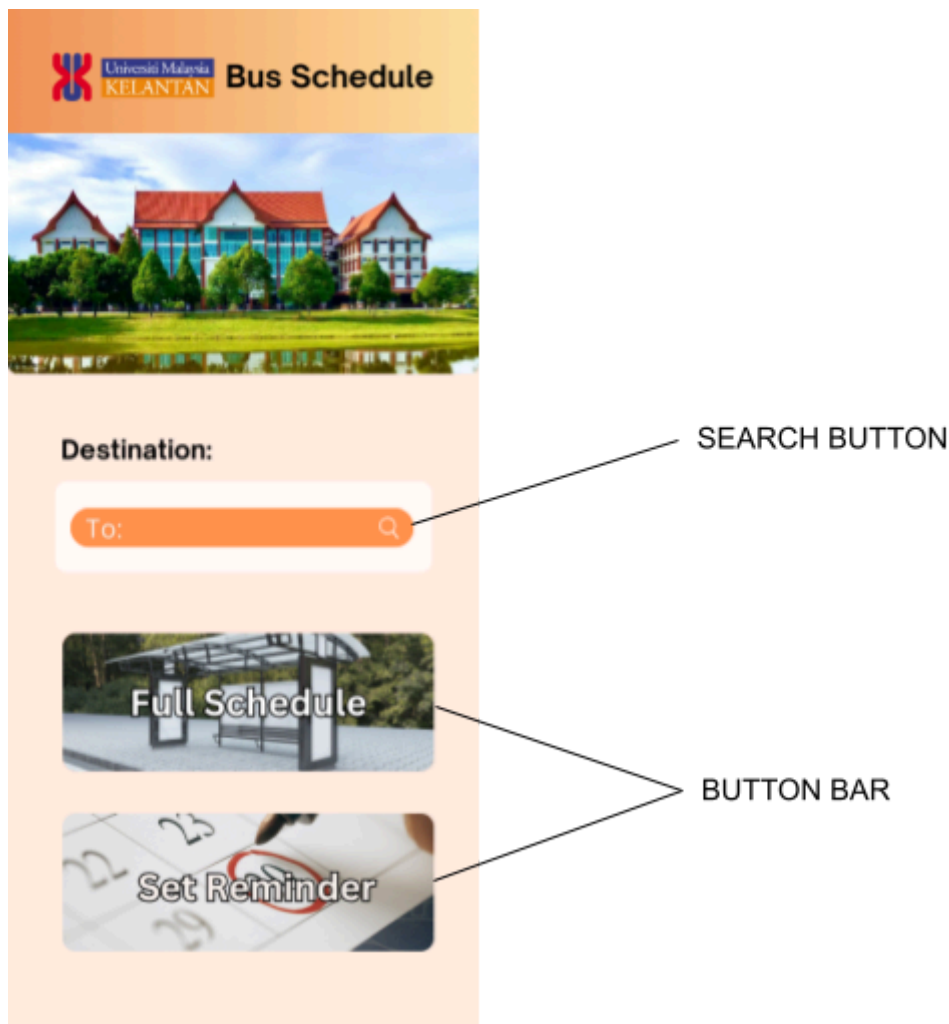

5.3 Users are able to select the time option to set the reminder.

Input: Select the destination, day and the time to remind.

Output: The reminder should remind the user to follow their preferences..

3. User Interface (UI) Design

- Sketch or digitally design the user interface (UI) of your mobile app.
- Focus on the core functionalities identified in step 2 and ignore features like login, logout, profile, or anything not directly related to the app's main purpose.
- Include all the different pages or screens a user would navigate through to complete a task using your app.
- Clearly label each screen and highlight the key elements on each page (buttons, menus, text fields, etc.).
